

Unit-2 - Knowledge Based Systems

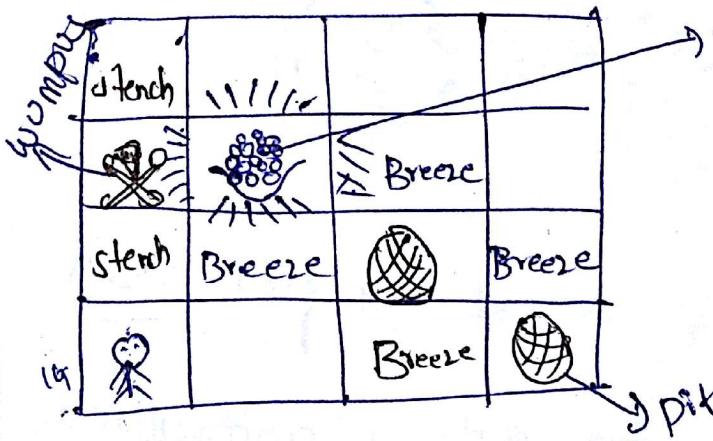

19-07-18 (Third)

Knowledge Based systems

wumpus game

> for this, graph theory is not visible since environment is not suitable.

- has to note clues & use whenever it requires.

gold
stench — glittering — gold

Breeze & (air) — pit

stench (bad smell) — wumpus.

- has to note clues

Disadvantages over graphs

- > has no option for noting environment
- > environment is partially observable
- > No Logic

so to make all this possible we are using
discrete mathematics

the wumpus game is solved by discrete mathematics so it is called "knowledge Based systems"

- i) Knowledge Base:- Rules & regulations & observations
i.e Rules & regulations + Background knowledge
- ii) Background knowledge-
- iii) Knowledge Representation :- (Discrete) propositions logic
- iv) Inference:- Based on previous knowledge we can deduce new knowledge.
- v) TELL :-
- vi) ASK :- Querying

Approaches:-

- i) procedural approach:- Total information is written in the form of programming
- ii) Declarative approach:- Information is represented mathematically.
- iii) entailment:- $\alpha \models \beta$ or $\alpha \vdash \beta$
by using α we deduce β

$$\text{ex:- } 4+5=9 \models 9=4+5$$

\downarrow \downarrow

by using these we can deduce these.

$\alpha \vdash \beta$
Algorithm A

Using Algorithm A we deduce α to β .

Propositions

\wedge - AND

\vee - OR

\sim - NOT

\rightarrow - implies

\Leftrightarrow - double implies

Formalizing simple sentences:

A = Aldo is Italian

B = Bob is English

a) $\sim A$

b) $A \wedge B$

c) $A \wedge \sim B$

d) $A \vee (\sim A \wedge \sim B)$

e) $(A \wedge B) \vee (\sim A \wedge \sim B) = A \Leftrightarrow B$

Inference rules

Given

Inference Rule name

1) $P \wedge Q$
 $\sim(P \vee Q)$

$P, Q \vdash P \cdot Q \models P \wedge Q$ Simplification

$\sim P, \sim Q \vdash P \vee Q \models \sim(P \wedge Q)$ Conjunction

2) P, Q

$P \wedge Q$

Disjunction Addition

4) $\sim(P \wedge Q), P$

$\sim Q$

Conjunctive Argument

$\sim(P \wedge Q), Q$

$\sim P$

5) $P \rightarrow Q, P$

Q

detachment

6) $P \rightarrow q$ $\neg q \rightarrow \neg P$ contrapositive

7) $P \rightarrow q, q \rightarrow r$ $P \rightarrow r$ chain Rule

8) $P \rightarrow q, \neg q$ $\neg P$ Modus Tollens

9) $P \rightarrow q, P$ q Modus Ponens

10) $(P \vee q), \neg P$ q Disjunctive Syllogism

11) $(P \rightarrow q) \cap (r \rightarrow s) (P \vee r)$ $q \vee s$ Constructive Dilemma

12) $(P \rightarrow Q) \cap (R \rightarrow S) \neg$ $P \vee R$ Destructive Dilemma

$\alpha \cup \neg s$

13) $\neg(P \wedge Q)$ $\neg P \vee \neg Q$ Demorgan's law

$\neg(P \wedge Q)$

$\neg P \vee \neg Q$

14) $\neg(\neg A)$ A Double negation

15) $A \Leftrightarrow B, A$ B

16) $A \Leftrightarrow B, B$ A

17) $P \rightarrow Q$
 $\neg P \rightarrow \neg Q$ $q \vee \neg q$ (q or not q Resolution)

① It is snowing, it is cold

it is cold, John is wearing coat

It is snowing

$s \rightarrow c$

$c \rightarrow j$

$\frac{s \rightarrow c}{\frac{c \rightarrow j}{\text{true}}}$

(P) i) If it is raining, it is not cold
If it is not raining, John is not wearing a coat

ii) If it is cold,
John is not wearing the coat

R \rightarrow NC
 $\neg P \rightarrow \neg J$

C, $\neg R, \neg J$

(P) i) If polo is thin, then carlo is not blonde or
Robert is not tall.

ii) If Robert is tall, then Sandra is a lovely

iii) If Sandra is lovely and Carlo is blonde then polo
is not thin.

iv) Carlo is blonde

Is Robert tall?

Sol: $P \rightarrow (\neg C \vee \neg R)$

R \rightarrow S

(S NC) \rightarrow P

C

R?

C - true
S - true

(composition) \Rightarrow

CNS - true then P - true.

\rightarrow

$a \rightarrow b$
true def true.
false may be

$a \leftarrow b$
true def true
false def false

$P \rightarrow (N_C \cup N_B)$
either one of them false
means P is false.

propositional logic

20-07-18 (Friday)

- > $\omega(i,j) \Leftrightarrow (S(i-1,j) \cap S(i+1,j) \cap S(i,j-1) \cap S(i,j+1))$
- > $S(i,j) \Leftrightarrow ((\omega(i-1,j) \cup \omega(i+1,j) \cup \omega(i,j-1) \cup \omega(i,j+1))$
- > $P(i,j) \Leftrightarrow (B(i-1,j) \cap B(i+1,j) \cap B(i,j-1) \cap B(i,j+1))$.
- > $B(i,j) \Leftrightarrow [(\omega(i-1,j) \cup \omega(i+1,j) \cup \omega(i,j-1) \cup \omega(i,j+1)) = 0]$
- > $G(i,j)$ and between others $\{ A \rightarrow B \wedge C \} \wedge \{(i,j) \text{ white} \}$
- > $A(i,j)$ symmetric on 2nd part $\{(0,0) \text{ black}\}$

$d \leftarrow \delta$
 $S(i, j) \Leftrightarrow w(\text{adj rooms})$
 false
 not lab visit
 what like below

false
 visit q and start - 2nd

sort - 3
 start - 2

$A \Leftarrow B$

$\sim A$

$\frac{\text{other}}{\text{other}} \text{ start} = 0$
 $\sim B$

$(\text{start } q) \leftarrow q$

value must be zero initially

visit q = 1 means

initial classification

$A + (0, 0) \cap (1-i, j) \cap (i+q, 2) \cap (i, j-i) \cap (i, i) \Leftarrow (i, i)$

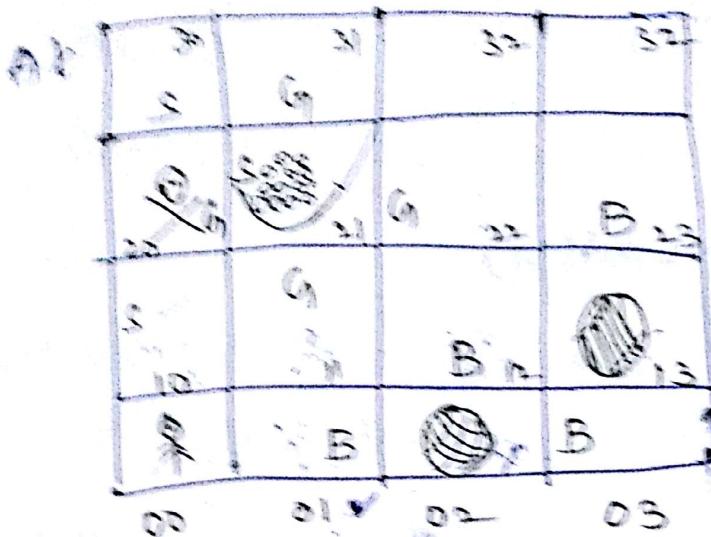

$\sim w(0, 0) \cap (1-i, j) \cap (i+q, 2) \cap (i, j-i) \cap (i, i) \Leftarrow$ 
 $\sim S(0, 0)$

$\sim w(0, 1) \cap (1-i, j) \cap (i+q, 2) \cap (i, j-i) \cap (i, i) \Leftarrow (i, i)$

$S(i, j) = [w(i-1), \cup w(i+1)] \cup [w(\cdot), \cup w(\cdot)]$

$\text{Safe}(i, j) \rightarrow \sim(w(i, j)) \{ \begin{array}{l} \text{stench - A} \\ \text{wumpus - B} \end{array} \}$ at 00 wumpus

so at (0, 0) there is no wumpus

> John is a king \exists king (John) \forall greedy (King)

> Someone is greedy.

> Richard is John's brother

> who is evil? -

i) King (John) \wedge Greedy (John) \rightarrow Evil (John)

ii) King (Richard) \wedge Greedy (Richard) \rightarrow Evil (Richard)

iii) King (John)

iv) Greedy (P1)

(P1 & John or Richard)

V Brother (John, Richard)

who is evil? \rightarrow P1 & John or Richard

2 psol Converting into FOL (First order logic)

• If there is \forall means we have to write all its respective noun

• If there is \exists means write some constant like P1, P2, P3

dog (D1) \wedge owns (Jack, D1) \rightarrow \forall dog (D1) \forall owner (O1) owns (O1, D1)

dog (D1) \vee cat (P1) \rightarrow animal (D1) \vee animal (P1)

dog (Tuna) \vee cat (Tuna) \rightarrow animal (Tuna)

dog .

Jack owns a dog

All dog owners are animal lovers

No animal lover kills animals

Jack or curiosity killed an animal.

Who killed the animal?

$\text{owns}(\text{Jack}, \text{AI}), \text{loves}(\text{PI}) \rightarrow$

Sol: First order logic

i) $\text{owns}(\text{Jack}, \text{dog})$

ii) $\forall x (\text{owns}(x, \text{dog}) \rightarrow \text{animal-lover}(x))$

iii) $\forall x (\text{animal-lover}(x) \rightarrow \neg \text{kill}(x, \text{animal}))$

iv) $\text{kill}(\text{Jack}, \text{animal}) \vee \text{kill}(\text{Curiosity}, \text{animal})$

Inference:

i) is in Inference only

ii) has \forall so apply \forall for all x .

* $\text{owns}(\text{Jack}, \text{dog}) \rightarrow \text{animal-lover}(\text{Jack})$

* $\text{owns}(\text{Curiosity}, \text{dog}) \rightarrow \text{animal-lover}(\text{Curiosity})$

iii) has \forall so remove \forall & apply (substitute nouns in x)

* $\text{animal-lover}(\text{Jack}) \rightarrow \neg \text{kill}(\text{Jack}, \text{animal})$

* $\text{animal-lover}(\text{Curiosity}) \rightarrow \neg \text{kill}(\text{Curiosity}, \text{animal})$

How to get sol?

proof $\text{owns}(\text{Jack}, \text{dog})$

$\text{animal-lover}(\text{Jack})$

$\neg \text{kill}(\text{Jack}, \text{animal})$

Sol
Sol

Kill(Curiosity, animal)

(P) The law says, it is crime for an American to sell weapons to hostile nations. The country Nono, an enemy of America has some missiles. All of its missiles are sold to it by colonel west, who is an American. prove that west is criminal.

First order logic

$\exists x \exists y \exists z (\text{American}(x) \wedge \text{weapon}(y) \wedge \text{hostile}(z) \wedge$

$\text{sells}(x, y, z) \rightarrow \text{criminal}(x))$

$\text{hostile}(\text{Nono})) \wedge \neg \text{hostile}(\text{west})) \rightarrow \text{criminal}(\text{west})$

$\forall y (\text{weapons}(y) \wedge \text{owns}(\text{Nono}, y)) \rightarrow \text{sells}(\text{west}, y, \text{Nono})$

Inference

$\rightarrow \text{American}(\text{west})$

$\rightarrow \text{hostile}(\text{Nono})$

$\rightarrow \text{weapon}(\text{w}) \wedge \text{owns}(\text{Nono}, \text{w})$

$\rightarrow \text{weapon}(\text{w}) \wedge \text{owns}(\text{Nono}, \text{w}) \rightarrow \text{sells}(\text{west}, \text{w}, \text{Nono})$

proof

$\text{hostile} \rightarrow \text{None}$

$\text{American} \rightarrow \text{west}$

$\text{Weapon} \rightarrow w$

$\text{sells}(\text{west}, w, \text{Nono})$

soft $\boxed{\text{west is criminal}}$

$\boxed{(\text{criminal}, \text{ptixious}) \text{II}} \rightarrow$

Inference in FOL (First order logic)

i) eliminate implication

$$A \rightarrow B \quad A \rightarrow B$$

$$\begin{array}{ccc} 0 & 0 & 1 \\ 0 & 1 & 1 \end{array}$$

$$\begin{array}{ccc} 1 & 0 & 0 \end{array}$$

introduction, such that having 00, 01, 10

ii) Move inwards

iii) Standardize variables:- use separate variable if there is interference

iv) Skolemization ($\exists x$ remove \exists)

v) Drop universal quantification

vi) Distribute \wedge over \vee

$$(A \wedge B) \vee C$$

$$\Rightarrow (A \vee C) \wedge (B \vee C)$$

to avoid

Forward chaining:- step-by-step from first repeating cycles till goal state by forward chaining only

$$1) A \wedge B \rightarrow F$$

$$2) A \wedge E \rightarrow G$$

$$3) B \rightarrow E$$

$$4) G \rightarrow D$$

database (true variables are

(except in this)

A, B, F, E, G, D

Prove that if A and B are true, D is true.

Backward chaining

- 1) $A \wedge B \rightarrow F$
- 2) $A \wedge E \rightarrow G$
- 3) $B \rightarrow E$
- 4) $G \rightarrow D$

Backward Chaining
Database query processing

A, B, E, G, D	A	B	C	D
---------------	---	---	---	---

1	0	0
1	1	0
0	0	1

Prove that, if A and B are true, Distributive

Sol: D - target
G.

A \wedge B

B

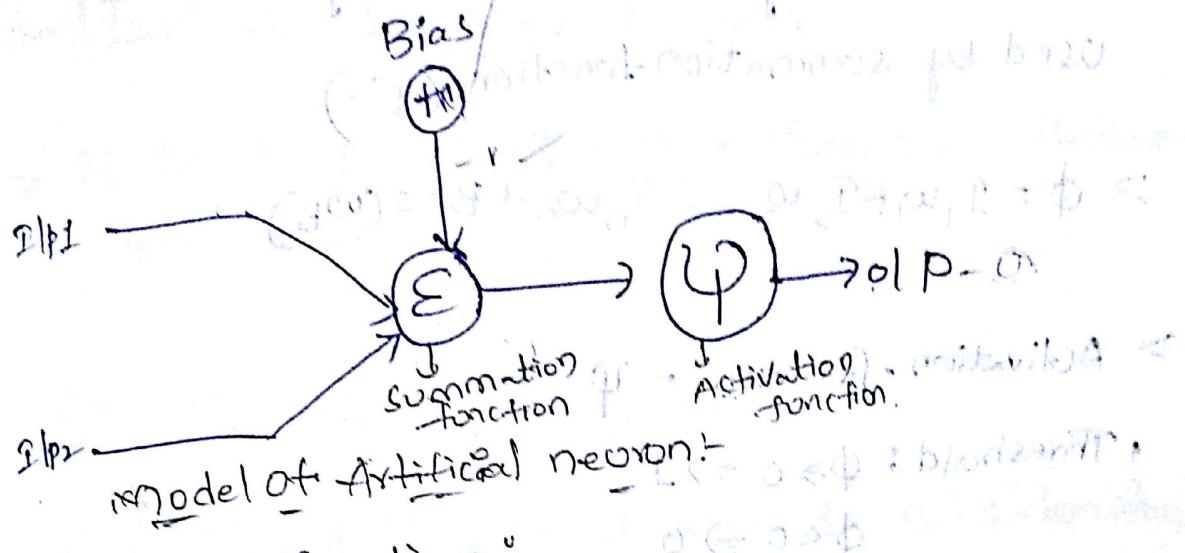

E

B

Backward programming is better than forward programming

Ans: most suitable for problems

Machine learning

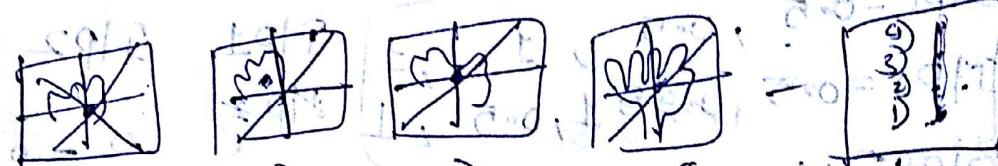

Classification:

i) Classification: Apple, Mango - Apple should recognize by machine.

ii) optical character recognition

ex:- A A A D - should recognize characters.

ex:- image recognition - here hand is up so volume raise

ex:- database recognition - In hospital new patient recognition.

ex:- text search engine - even though we type wrong in google it gives right some information

ex:- machine translation - one language to other language

ex:- text audio:

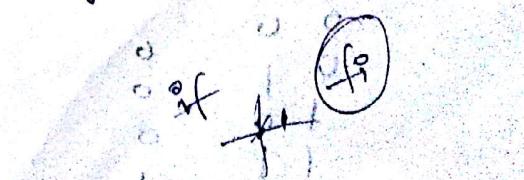

fig:- Model of Artificial neuron.

> for each & every input there is weight which is used by summation function (Σ)

$$\Phi = I_1 w_1 + I_2 w_2 + \dots + I_n w_n + \text{Bias} (w_b)$$

> Activation function. - ψ

Threshold: $\Phi \geq 0 \Rightarrow 1$

$\Phi < 0 \Rightarrow 0$

tanh
sigmoid

> By using AND gates we get o/p

$$\begin{array}{c} I_1 P_1 = 0.5 \\ I_1 P_2 = 0.5 \\ \text{Bias} = 0.25 \end{array}$$

$$w_1 = 0.5, w_2 = 0.5, w_3 = -0.75$$

$$\Phi = I_1 w_1 + I_2 w_2 + \dots + I_n w_n + \text{Bias} (w_b)$$

$$\Phi = 0.5(0.5) + 0.5(0.5) + (-0.75) = 0.25 + 0.25 - 0.75 = -0.25$$

by threshold function $\Phi < 0 \Rightarrow 0$

0	0	0
0	1	0
1	0	0
1	1	1

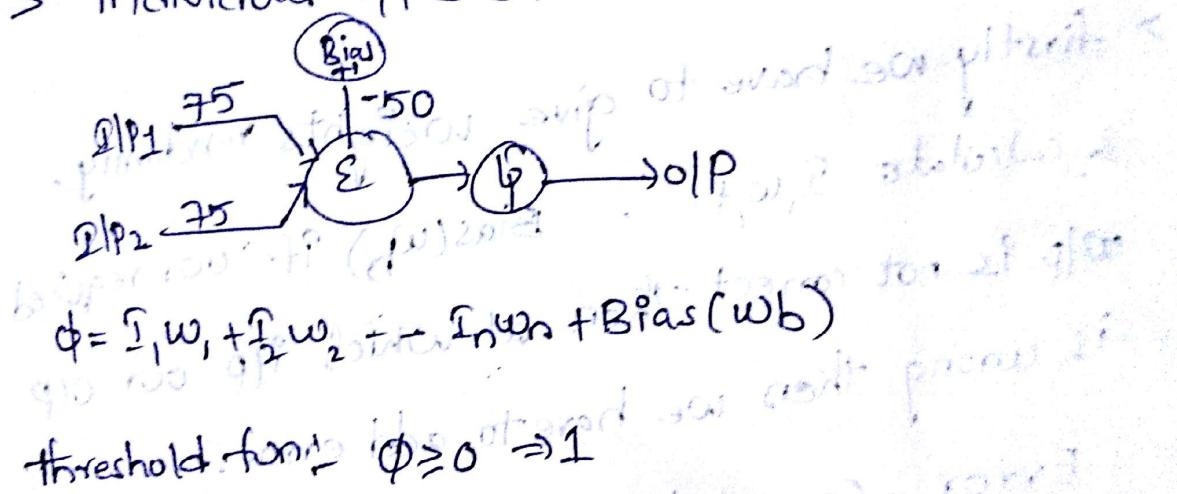

> for AND gate - I/P₁ { These are individual
- I/P₂ }
should be

then dominated by Bias function.

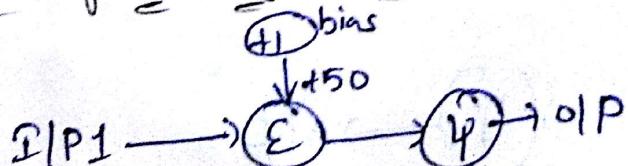

> if I/P₁ & I/P₂ combine then they should dominate
Bias function.

OR gate by neural network

> individual I/P's should dominate Bias function

Not gate by neural network

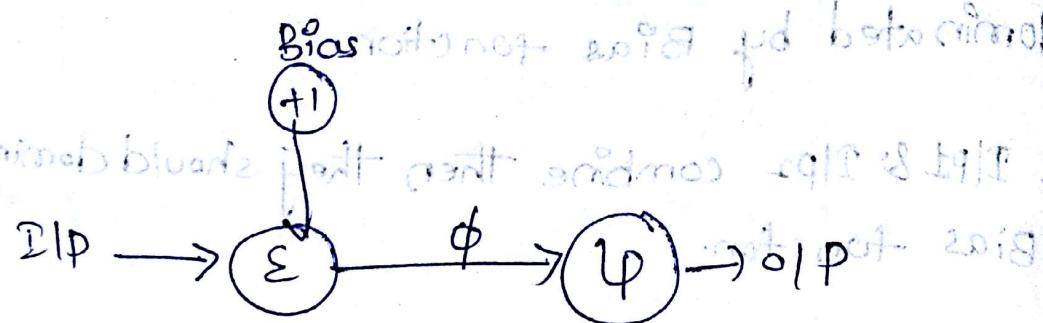

$$0(-100) + 1(50) \Rightarrow 1 \quad \left\{ \begin{array}{l} \Phi = I_1 w_1 + I_2 w_2 - \sum w_i + \text{Bias}(w_b) \\ \text{threshold func: } \Phi \geq 0 \Rightarrow 1 \\ \Phi < 0 \Rightarrow 0 \end{array} \right.$$

$$1(-100) + 1(50) \Rightarrow 0$$

Back propagation Algorithm & ~~AI~~

(How machines learn?)

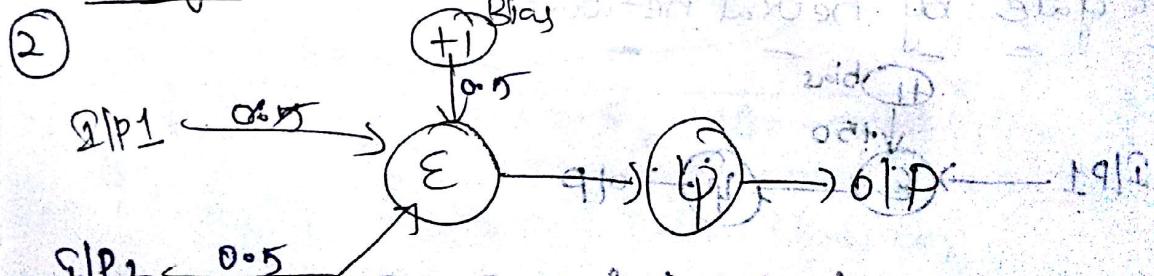

$\begin{cases} 1, \text{ if } \phi \geq 0 \\ 0, \text{ if } \phi < 0 \end{cases}$ Threshold Activation.

> firstly we have to give weights randomly.
 & calculate $I_{w,t}$. Bias(w_0) if our required
 OIP is not correct then at which $w_0 + w_1 t = 0$
 is wrong then we have to add error.

Error = (Expected OIP - Actual OIP)

OR gate

i) $IIP_1 \oplus IIP_2 + \text{Bias}$ $w_1 = 0.5$; $w_2 = 0.5$

$0 \quad 0 \quad | \quad w_2 = 0.5$

$0 \quad 1 \quad | \quad \text{bias} = 0.5$

1 1 1 ✓

0 0 1 X

$(\log 0.5 - \log 0.2) \text{ if } w < 0$

$$f(x) = \begin{cases} 1, & \text{if } \phi \geq 0 \\ 0, & \text{if } \phi < 0 \end{cases}$$

Threshold

Activation

$$(i_1)x_1 + (i_2)x_2 + (i_3)x_3 + \dots$$

OR Gate

			Q
	0	1	0
0	0	1	1
1	0	1	1
1	1	1	1

$$\Delta w_t = w_t + \lambda \cdot \text{IP}(\text{Error}) \cdot 0.0 \cdot (1.0) + 0.0 \cdot (1.0)$$

$$\boxed{\Delta w_t = w_t + \lambda \cdot \text{IP}(\text{Exp val} - \text{Act val})}$$

i/p 0 0 weights 0.5 0.5 0.5

$$= 0 \times (0.5) + 0 \times (0.5) + 1 \times (0.5)$$

$$= 0 + 0 + 0.5 \quad \text{so o/p is } 1$$

$$= 0.5 > 0 \quad \text{so o/p is } 1$$

$0 \ 0 > 1 \times$ so Add error to i/p's
error = Expected val - Actual value

$$= 0 - 1$$

$$= -1 \quad (0.5 + 0.5) + (0.5) \times 1$$

now

$$= 0 \times (-1) \times (0.5) + 0 \times (-1) \times (0.5) + 1 \times (-1) \times (0.5)$$

$$= (0) + (0) \times (-0.5)$$

So weights are

$$\underline{0.5 \ 0.5 \ -0.5}$$

now

$$= 0 \times (0.5) + 0 \times (0.5) + 1 \times (-0.5)$$

$$= 0 + 0 - 0.5$$

$$= -0.5 < 0 \quad \text{so it is } 0 \quad \text{then o/p is } 0$$

$$\begin{matrix} 0 & 0 \\ 0 & 1 \end{matrix}$$

$$= 0(0.5) + 1(0.5) + 1(-0.5)$$

$$= 0 + 0.5 - 0.5$$

$$= 0 \quad \text{o/p is } 1 \checkmark$$

> 10

$$(\text{O}_2) \times 1 + (\text{CO}) \times 0 + (\text{C}_2\text{H}_5\text{OH}) \times 0$$

$$= 1 \times (0.5) + 0 \times (0.5) + 1 \times (-0.5)$$

$$= 0.5 + -0.5$$

$$= -0.5 \quad \text{Op is } \pm$$

10

$$1 \times (0.5) + 1 \times (0.5) + 1 \times (-0.5)$$

~~10 1 ✓ solv. H_2O + borax = 1000g~~

> 11

$$1 \times (0.5) + 1 \times (0.5) + 1 \times (-0.5)$$

$$= 0.5 + 0.5 + (0.5) \times 1 + (0.5) \times 0 + (0.5) \times (-1) \times 0$$

$$= 0.5 \geq 0 \quad \pm$$

10

$$1 \times (0.5) + 1 \times (0.5) + 1 \times (-0.5)$$

$$(0.5) + (0.5) + (0.5) \times 0$$

$$0.5 + 0.5 + 0$$

ANN training using python

ID	features			target decision
	Branch	Marks	conduct sports	
CSE(0)	89	excellent(3)	Yes(0)	✓
CSE(0)	64	Bad(0)	Yes(0)	✗
ECE(1)	72	Good(2)	No(1)	✓
MECH(2)	54	Satisfactory(1)	Yes(0)	✗

nominal data numeric data ordinal binary Binary

ii) Sklearn

Encoders

→ `LabelEncoder` - for converting text
 → `One-hot encoder` - to number.
 no need of order (e.g. Maths, Physics, Chemistry).

no-order = nominal data

order = ordinal

1) Load dataset (i.e. .csv)

2) eliminate unnecessary fields

3) X = features

y = target decision

4) encoding

5) Training.

> to remove order in nominal data
 we use one-hot encoder
Branch

i.e. CSE ECE MECH

1	0	0
1	0	0
0	1	0
0	0	1

slip layer - 60% Branch - 30% Marks - 1
- 10% conduct - 1
- 10% sports - 1

$$3+1+1+1=6 \text{ birds}$$

old layer - 1 : placement - 1

hidden layer = input layer + output layer

anno.py is reference for all files.

A* Deep learning

target decision

Weather dataset		features				target
		outlook	Humidity	Temp	Windy	Play
Rainy						Yes
Sunny						No
Overcast						No

here label encoding is required when there is required
overlap

of conversion from text to number.
so for outlook, windy, play we need label encoding

> here for target one-hot encoder is required when
there is no-order means (subjects, outlook)

Rainy sunny overcast

so now o/p layer = 3
outlook = 3
humidity = 1
Temp = 1
windy = 1

$$3+1+1+1=6$$

o/p layer - 1 ∵ play

hidden layer = 3 (play) / o/p layer

$$\text{hidden layer} = \frac{6+1}{2} = 3.5$$

18-08-18 (Tuesday)

Tent classification using ANN

passage:

Rama was the King of Ayodhya.

Rama's wife is Sita. Rama had a son. Rama killed Ravana.

Question:

Who is Rama's wife?

using NLTK (Natural language tool kit) has the code to work out.

Step 1: stop words Removal: Removing the unnecessary word's like is, the, had etc. who's, is, are, etc.

Step 2: Lemmatization: Rama, Rama's, study, studied, study, studying.

Step 3: Unique words!

Rama Sita
King, two sons
Acyodhya killed
wife Ravana

World to vectors, matrix!

Rama King Ayodhya wife Sita two sons killed Ravan

match the Question with above passage lines

match question with ~~poor~~ first line of passage; 3 are different

match question with 2nd line of passage: **is different**

match question with 3rd line of passage? 2 is different

match Question with 9th line of passage: 3 is different.

least different^{line} is the answer. (i.e. 1 is different for 2nd line)

Ans: Rama wife Sita =

This was the very basic. Antonyms & synonyms should be added more to get accuracy

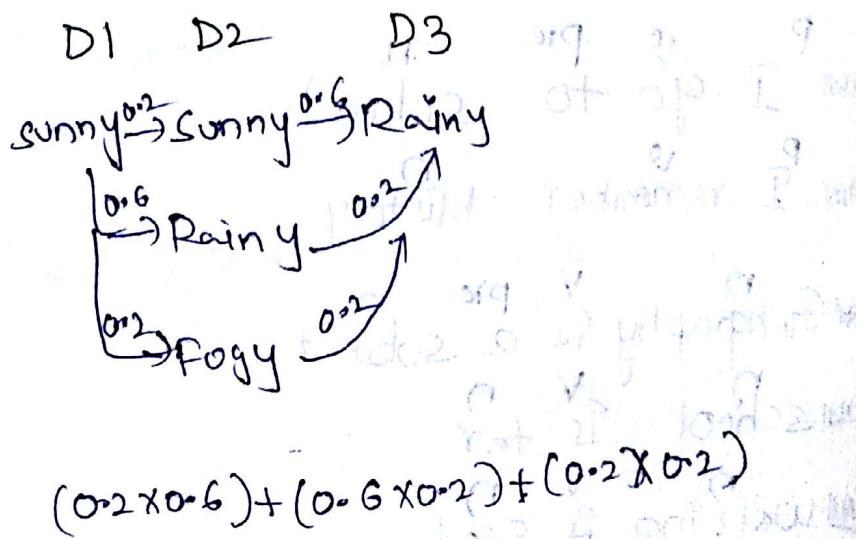

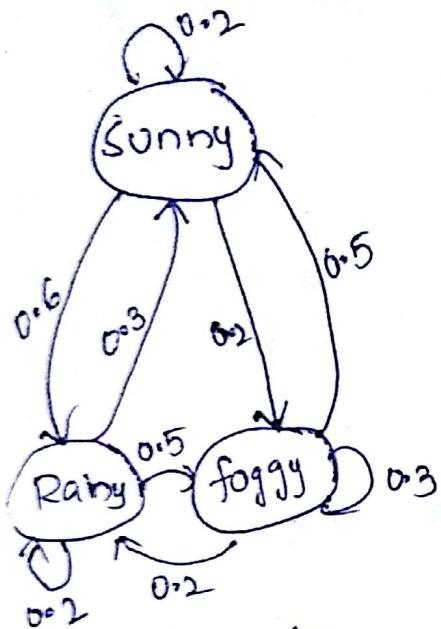

More Reviews passage!

The direction was good. Movie hero acting was awesome.
Best comedy. Best comedy. Best Movie of the year. Worst
experience. Music was bad.

Acting was bad.

Unique words and direction, good Movie, hero, acting
Awesome, Best, comedy, year, won't, experience, Music, bad

Hidden Markov Models (parts of speech Toggling in text)

> automatic parts of speech is for Markov Model.

- ① To know what is the probability of next day whether sunny, rainy, foggy when person brings Umbrella along with launch for the person who is in the car zoom

Umbrella probability

sunny - 0.2

foggy - 0.1

rainy - 0.7

today sunny - tomorrow sunny \Rightarrow Umbrella prob $\Rightarrow (0.6 \times 0.7)$

Sunny - rainy & " " \Rightarrow $(0.6 \times 0.3) + (0.4 \times 0.7)$

Par

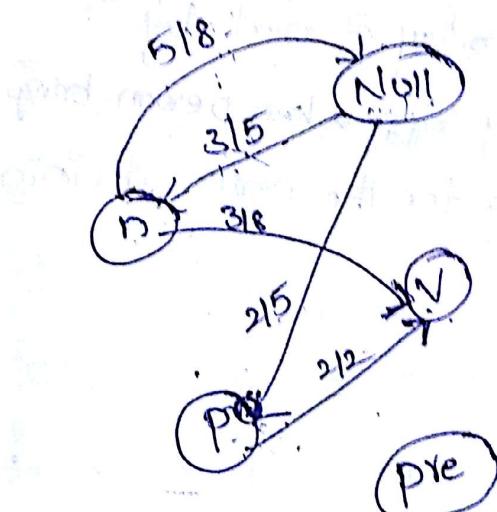

Null P I V pre N
Null I go to school

Null P I V n
Null I remember History

Null Geography V pre N
Null Geography is a subject

Null School V N
Null School is far

Null Walking V N
Null Walking is good

Q) I drink tea

\Rightarrow I \rightarrow what is the probability of I to be pronoun & noun & verb & preposition from null because (I is)

$$= \left(\frac{2}{5}\right) \left(\frac{\text{pronoun}}{I}\right) + \left(\frac{3}{5}\right) \left(\frac{\text{noun}}{I}\right) + \left(\frac{0}{5}\right) \left(\frac{\text{verb}}{I}\right) + \left(\frac{0}{5}\right) \left(\frac{\text{preposition}}{I}\right)$$

$$= \left(\frac{2}{5}\right) \left(\frac{2}{2}\right) + \left(\frac{3}{5}\right) \left(\frac{1}{2}\right) + \left(\frac{0}{5}\right) \left(\frac{0}{2}\right) + \left(\frac{0}{5}\right) \left(\frac{0}{2}\right)$$

$$= \left(\frac{2}{5}\right) \left(\frac{2}{2}\right) + 0 + 0 + 0$$

$$= \frac{2}{5} \text{ so } I \text{ is the highest probability of being pronoun}$$

$\Rightarrow \underline{\text{drink}}$

what is the probability of drink as pronoun non levable
preposition from It pronoun)

$$\left(\frac{2}{2}\right) \left(\begin{array}{c} \text{verb} \\ \text{drink} \end{array} \right) + \left(\begin{array}{c} 0 \\ \text{drink} \end{array} \right) + \left(\begin{array}{c} \text{preposition} \\ \text{drink} \end{array} \right) + \left(\begin{array}{c} 0 \\ \text{drink} \end{array} \right)$$

$$\left(\frac{2}{2}\right) \left(\frac{0}{0} \right) = 0$$

4) sentimental analysis

ANN Theory

Features of ANN (Artificial Neuron)

1) Robust & Fault tolerant.

2) Flexible

3) Adaptable (Noisy, probabilistic, inconsistent)

4) collective computation

from Biological neuron we designed Artificial neuron.

1) Robust & fault tolerant

2) flexible -

3) Adaptable

4) collective computation - parallel processing

Comparison of classical vs NN

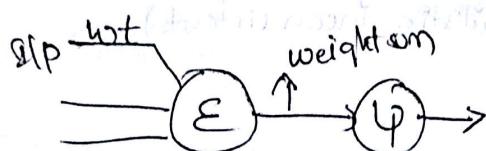

Classical	NN
Speed: fast	slow
processing: sequential	parallel (at a million of neurons come into picture) - massively
size & complexity: small & simple	large & complex
storage: Memory units - bits units to store information	Synaptic weight

	Classical	ANN
fault tolerance :	less	more
control mechanism:	CPU (central)	Distributed control

ANN Terminology

1) processing unit

- Activation value (Weighted sum)
- Excitatory IIP
- Inhibitory IIP

after adding weights if weights are +ve - Excitatory IIP
 " " " " " " " " " " - ve - Inhibitory IIP

2) Interconnection :- interconnection b/w IIP & OIP

- IIP state
- OIP state

3) operation.

- Activation dynamics. \rightarrow total IIP values

4) update? It says how to modify neuron to get correct OIP

Synchronous/Asynchronous

Deterministic/Stochastic

Changing weights at a time for all neurons - synchronous.

Changing weight step by step for all neurons - asynchronous.

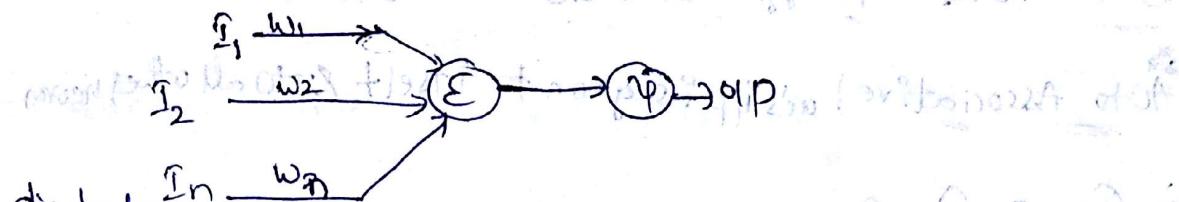

Dependency of one state to another - Deterministic

Opposite of Deterministic - Stochastic

Models of a Neuron

1) McCulloch - Pitts Model

- fixed weighted I/p summation & o/p function

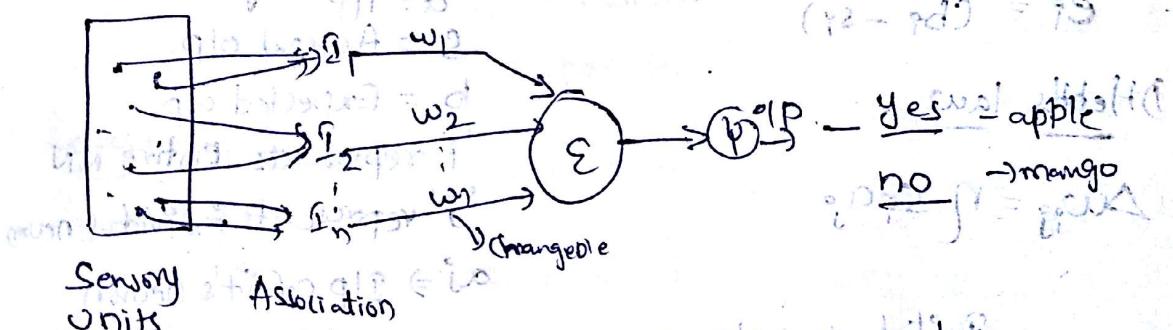

disadvantage: learning was not possible. \because fixed weights (which cannot be changed) by that we cannot change to our required o/p.

2) Perception Model

- In a world there is sensory unit (listening, speaking, visible sensing)

which are connected to ILP & weights are changeable to change.

- here classification is only one type either yes/no /apple

3) ADALINE Model

Same as perception but they proposed a new model which can calculate continuous values also such as -10 , 10 , 100 .

Topology

Geometrical arrangement of neurons.

Layer 1 to Layer 2 — Instar Topology

Layer 2 to Layer 1 — outstar topology

Group of Instas :- group of neurons giving o/p to group of neurons ($L_1 - L_2$)

Group of outts :- same as group of insts but ($L_2 - L_3$)

Bidirectional topology :- If there is no direction

Auto Associative :- one's o/p is given to itself & to all other neurons

Basic learning Laws

$$W(t+1) = W(t) + \Delta W$$

Error = Expected - Actual

$$e_i = (b_i - s_i)$$

DHebb's law

$$\Delta W_{ij} = \eta \cdot s_i \cdot a_j$$

Initial wts \Rightarrow Near zero

learning \rightarrow unsupervised

η = learning rate constant

a = o/p

b = Expected o/p

i represents entire NN

j represents individual neuron

$a_j \Rightarrow$ o/p of it's neuron

$e_i \Rightarrow$ error of entire system

2) Perception learning law

$$\Delta W_{ij} = \eta \cdot (e_i) \cdot (s_i)$$

Initial wts \Rightarrow Random

learning \Rightarrow supervised

\because If there is bo - Exp

d o/p means we are

saying, o/p so it

is supervised learning

3) Delta learning

$$\Delta W_{ij} = \eta \cdot (e_i) \cdot \frac{d}{dx} (s_i) \cdot s_i$$

Initial wts \Rightarrow Random

learning \Rightarrow supervised

a) Correlation learning

$$\Delta w_{ij} = \eta \cdot b_i \cdot a_j$$

Initial wts \Rightarrow near zero

Learning \rightarrow supervised

b) Winner-Take-All (Instar) learning

$$\Delta w_{kj} = \eta (a_j - w_{kj})$$

Initial wts \Rightarrow Random

Learning \rightarrow Unsupervised

c) out star learning

$$\Delta w_{kj} = \eta (b - w_{jk})$$

Initial wts \Rightarrow Random

Learning \Rightarrow Supervised

d) Least Mean square (LMS) learning

$$\Delta w_{kj} = \eta (\text{LMS error}) a_j \quad \text{LMS error}$$

Initial wts \Rightarrow Random

Learning \Rightarrow Supervised

$$\begin{array}{l} \text{Case 1: } 2^2 + 2^2 = 8 \\ \text{Case 2: } 3^2 + 1^2 = 10 \\ \text{Case 3: } 2^2 + 3^2 = 13 \end{array}$$

$$\begin{array}{l} \text{Case 1: } 2^2 + 2^2 = 8 \\ \text{Case 2: } 3^2 + 1^2 = 10 \\ \text{Case 3: } 2^2 + 3^2 = 13 \end{array}$$

$$\begin{array}{l} \text{Case 1: } 2^2 + 2^2 = 8 \\ \text{Case 2: } 3^2 + 1^2 = 10 \\ \text{Case 3: } 2^2 + 3^2 = 13 \end{array}$$

Here in all cases error is 4 units if we do square it we get correct error

$$\text{Case 1: } 3^2 + 1^2 = 10$$

$$\text{Case 2: } 2^2 + 3^2 = 13$$

$$\text{Case 3: } 2^2 + 2^2 = 8 \quad \text{This having least error in dp.}$$

ANN - Theory -- contd

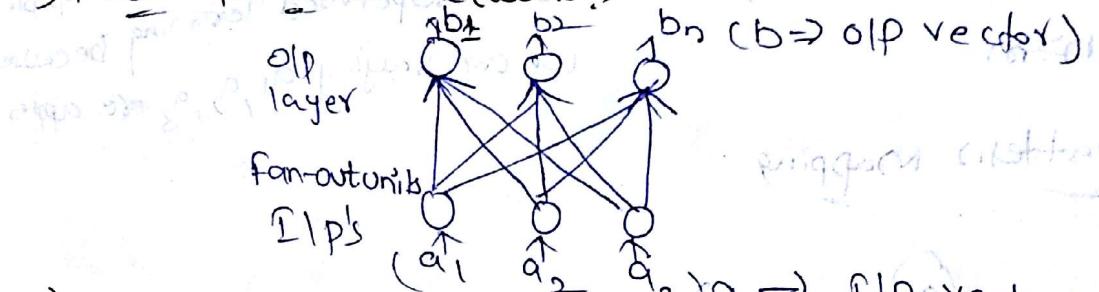

27-08-18
day

pattern Recognition problem

If new sample is given it has to detect which is done in pattern recognition problem.

Basic functional units

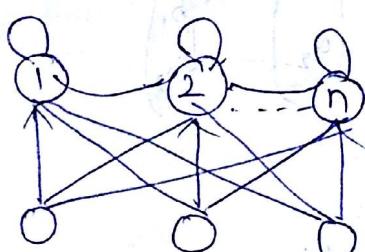

1) Feed forward Network

2) feedback Neural Network

3) competitive learning NW

Feed forward + feed back Neural

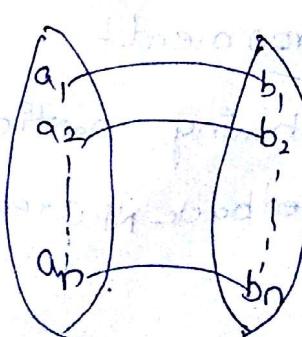

The actions done by these 3 pattern Recognition NW.

1) Feed forward Network.

a) pattern association

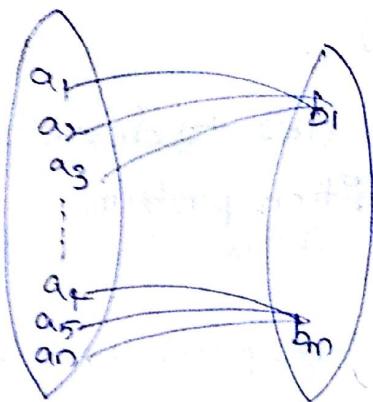

x	$x^2 + 1$
1	2
2	5
3	10

If 1.0.5 then gives OIP as. $\rightarrow 2$

here though sound is not clarity i.e. if exactly also it recognizes the correct sound $a_1 \cdot 5 \rightarrow b_1$

b) pattern classification

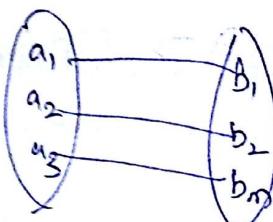

$n \geq m$

if apple shape & size is
different it recognize it
is apple (a_1, a_2, a_3) (b_1)
diff apples \rightarrow same

here supervised learning
we are saying a_1, a_2, a_3 are apple

c) pattern mapping

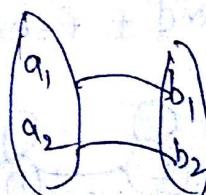

here it gives number

2) Feed back Neural network:

a) Auto Association:

here it recognizes itself i.e.
some feed back is required

b) pattern storage:

by using feedback it stores pattern as same as flipflops
Storing Electrical signals.

c) pattern Environment

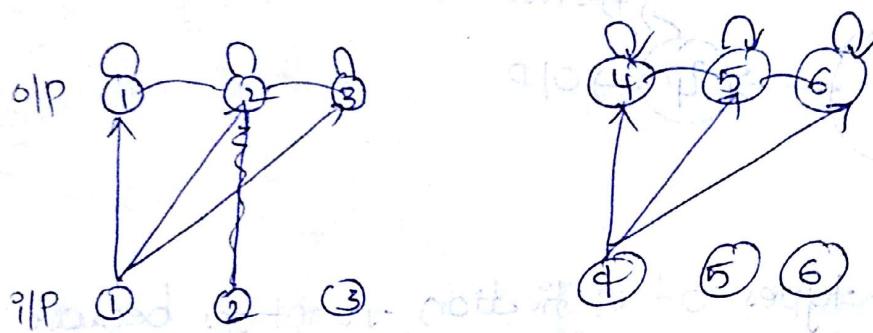

The prob of having particular pattern .

for there also feedback NW required

3) competitive learning NW

a) Temporary pattern storage.

To store pattern temporarily we use this

if IIP 1, 2, 3 OLP also

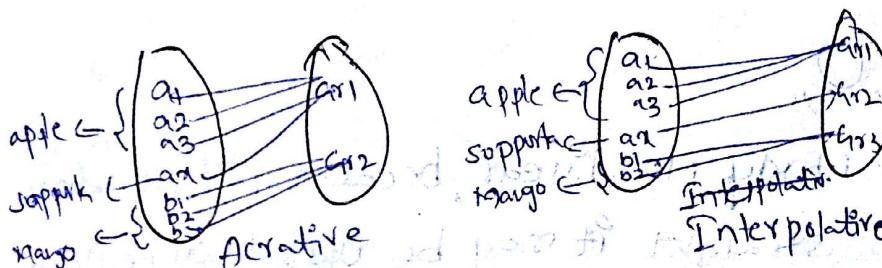

1, 2, 3 if IIP changes to 4, 5, 6 then OLP also 4, 5, 6 means

at particular time

temporarily what IIP is present it gives that OLP. i.e

for temporary storage

b) pattern clustering :- same as pattern classification
but here unsupervised learning we are not giving prior (chaining)
Acritative :- If 2 apples, 3 mangoes are present if supports
Interpolative :- comes than it matches with apples based on shape
If 2 apples, 3 mangoes are present if supports
is matched with separate group

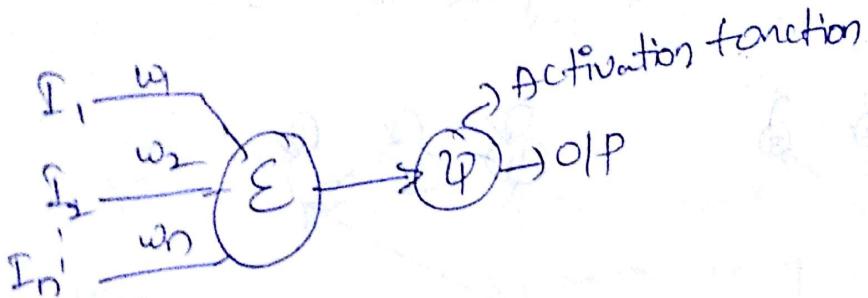

c) feature Mapping:-

30-08-16 (Tues)

Types of Activation functions

To produce final o/p we use Activation function.

> There is diff types of Activation functions because different projects require different activation function, based on our activation function project we design.

Activation function

1) Linear

2) Non Linear

~~atby+c~~

$$f(x) = x \text{ Range } (-\infty, +\infty)$$

Non-linear

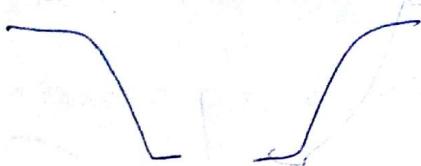

$\sim\sim, \cap, \circ,$

Why we need to study Non-Linear, because all situations need not be straight it may be up & down i.e. M ,

↳ Differentiation:-

The o/p should be differentiable then error will be derived

Monotonic

Non-linear

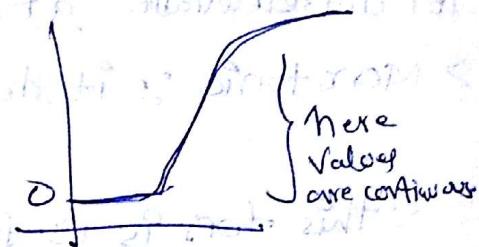

Sigmoid function

$$f(x) = \frac{1}{1+e^{-x}}$$

Range \Rightarrow 0 to 1 (continuous)

\therefore this function is very useful

in probability because it is non-linear > it has slope
has continuous values

\Rightarrow it is differentiable?

it has slope

\Rightarrow it is monotonic

is decreasing function

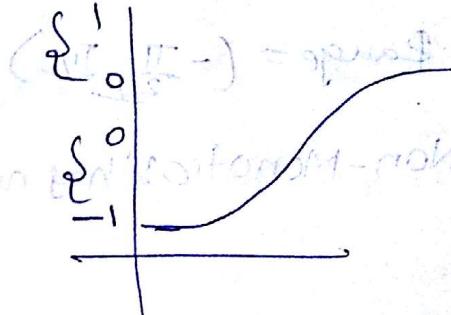

2) Tanh or hyperbolic tangent-

$$\Rightarrow f(x) = \tanh(x)$$

Range = -1 to +1

Differentiable

Monotonic

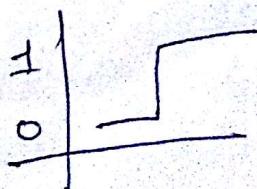

\therefore this is very useful in knowing whether the person is suffering from cancer or not

3) Threshold function (Binary step)

1 if $x \geq 0$

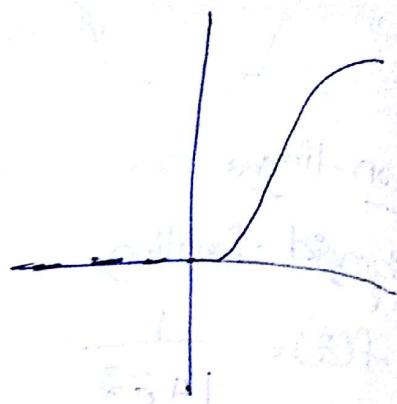

$$f(x) = \begin{cases} 0 & \text{if } x < 0 \\ 1 & \text{if } x \geq 0 \end{cases}$$

It says whether 0 or 1 whereas in sigmoid function from 0 to 1 these are continuous values.

4) Re LU (Rectified Linear Unit)

$$f(x) = \begin{cases} 0 & \text{if } x < 0 \\ x & \text{if } x \geq 0 \end{cases}$$

- > Differentiable \therefore has slope
- not differentiable at $x=0$ after that
- > Monotonic \therefore it decreasing for

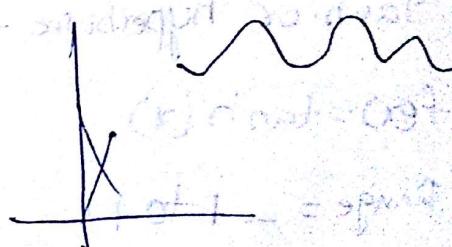

\because this function is useful in ReLU where there is no difference
 in -1 whether test is done / not but in +1 we
 have to test for the cancer patient

5) Arc tan

$$f(x) = \tan^{-1}(x)$$

$$\text{Range} = (-\frac{\pi}{2}, \frac{\pi}{2})$$

Non-Monotonic \therefore has no slope.
